What makes your dentist different?  
*He uses laser technology*

The innovative techniques of the Doctor Smile laser have made fear of dentists a thing of the past.

The Doctor Smile laser works in full respect of the tissue present in the oral cavity, therefore it is precise, safe, efficient, and in the majority of cases painless.

### WHY USE A LASER?

Using a laser reduces the possible need of anaesthetic, sutures and pharmaceuticals when carrying out surgical and therapeutic interventions. A fast recovery therefore, which avoids unpleasant post-operative complications.

### AN INSTRUMENT FOR EVERYONE

The laser can be used with all patients, and is extremely comfortable for both children and adults. It is reliable, and can be used effectively on patients with cardiovascular and coagulation pathologies. Laser treatment is invasive at a minimum level, is safe, efficient and fast.

The Doctor Smile laser gives different advantages to the dentist, as well as to those patients who are difficult to treat.

### COMFORT

In comparison with traditional mechanical systems, the laser does not transmit vibrations or sensations of pressure to the patient because numerous treatments are carried out without contact. It biostimulates and decontaminates for safe, fast healing without complications.

### SAFETY

The Doctor Smile laser can be used to biostimulate, decontaminate, remove tooth decay and take care of unhealthy tissue without attacking the surrounding healthy tissue. This is why laser therapy is defined as being “invasive at a minimum level”.

### A SURE APPOINTMENT

The benefits of using the laser include less post-operative trauma, faster healing and fewer check ups, therefore surprising results from a clinical and aesthetic point of view.

## LASER TREATMENT AND THERAPEUTIC PROTOCOLS

Laser treatment can be used to treat multiple pathologies such as gum care, the removal of tooth decay, desensitisation, whitening, surgery and aesthetics. The laser can be used for an incredible number of applications that work alongside, and in many cases replace, traditional techniques and therapeutic protocols.
